

# Winter 2022 SGC 3A Data Cleaning

Amy Rae Fox

02/22/2022

*The purpose of this file is processing the combined data files for Winter 2021 into study-level files that contain only valid data for analysis, excluding invalid sessions and participants*

Data is imported from 2 files, indicating two levels of analysis: participants and blocks (item-level).

**Note:** mouse-cursor data contained in final\_mouse\_blocks.json file is not handled here.

```
#IMPORT DATA
df_participants <- fromJSON("combined_files/winter22_sgc3a_final_participants.json")
df_items <- fromJSON('combined_files/winter22_sgc3a_final_items.json')
```

```
#add term indicator
df_participants$term <- "winter22"
df_items$term <- "winter22"
```

```
#DEFINE SGC_3A validity criteria
sessions <- c('wi22sona') #SGC3A second online replication on SONA
conditions <-c(111,121) #2 conditions
violation_threshold = 3 #number of allowable browser violations
effort_exclusion = c("I didn't try very hard, or rushed through the questions")
```

```
#placeholder for excluding participants
ex_participants = data.frame()
```

```
#create factors in PARTICIPANTS
df_participants <- df_participants %>%
  mutate( #create factors and remove extraneous ""
    subject=factor(subject),
    condition=factor(condition),
    session=factor(session),
    term=factor(term),
    sex = as.factor(gender),
    age = as.integer(age),
    country = gsub("'", "", country),
    year = factor(schoolyear),
    native_language = factor(language)
  ) %>% select(
    -"_id"
  )
```

```
df_items <- df_items %>%
  mutate(
```

```

subject=factor(subject),
condition=factor(condition),
session=factor(session),
term=factor(term),
explicit=factor(explicit),
grid=factor(grid),
impasse=factor(impasse),
q=factor(q)
) %>% select(
  -"_id"
)

```

## Data Validation

### Completion Status

Starting with Winter 2022, data are saved to the database even if the subject's browser did not meet minimum specifications (at which point they are prompted to change browsers, or end the study). This allows us to learn about the browsers, screen sizes and OS that (potential) subjects are using. However, these data are *not* exported from the database for analysis (see `flatten.js` and `status.js` scripts). Thus, only subjects who successfully completed the entire study are included in this file.

```
#MANUALLY INSPECT status
```

```
df_participants %>% group_by(status) %>%
  dplyr::summarize(n=n())
```

```
## # A tibble: 1 x 2
##   status      n
##   <chr>   <int>
## 1 success     82
```

```
#DISCARD participants from invalid sessions
```

```
exclude_status <- df_participants %>%
  filter(status != "success") %>%
  mutate(reason="invalid-status")
```

```
ex_participants <- rbind(ex_participants, exclude_status)
rm(exclude_status)
```

```
df_participants <- df_participants %>%
  filter( ! subject %in% ex_participants$subject)
```

*No data need to be excluded on account of completion status.*

### Conditions

Participants are randomly assigned to an experimental condition when starting the study. Here we validate that only conditions for the current study are included in this dataset.

```
#MANUALLY INSPECT conditions
df_participants %>% group_by(condition) %>%
  dplyr::summarize(n=n())
```

```
## # A tibble: 2 x 2
##   condition      n
##   <fct>      <int>
## 1 111         38
## 2 121         44
```

Data from conditions *not* corresponding to valid conditions should be discarded.

```
#DISCARD participants from conditions invalid for this study
exclude_condition <- df_participants %>%
  filter(!condition %in% conditions) %>%
  mutate(reason="invalid-condition")

ex_participants <- rbind(ex_participants, exclude_condition)
rm(exclude_condition)

df_participants <- df_participants %>%
  filter( ! subject %in% ex_participants$subject)
```

*No data need to be excluded on account of condition.*

## Sessions

The (string) `session` code is embedded in the URL querystring by the experimenter to differentiate testing sessions in SONA from demo and other environment setup tasks.

```
#MANUALLY INSPECT sessions
df_participants %>% group_by(session) %>%
  dplyr::summarize(n=n())
```

```
## # A tibble: 1 x 2
##   session      n
##   <fct>      <int>
## 1 wi22sona    82
```

Data from sessions not corresponding to valid sessions should be discarded.

```
#DISCARD participants from invalid sessions
exclude_session <- df_participants %>%
  filter(!session %in% sessions) %>%
  mutate(reason="invalid-session")

ex_participants <- rbind(ex_participants, exclude_session)
rm(exclude_session)

df_participants <- df_participants %>%
  filter( ! subject %in% ex_participants$subject)
```

*No data need to be excluded on account of session.*

## Browser Interaction Violations

Browser interaction data is recorded by jspsych allowing us to determine if subjects violate our instructions not to leave the browser tab (or exit fullscreen mode) during test. These incidents are recorded in jspsych interaction data object, and the number of violations is counted and added to the participant data file.

Due to eccentricity of the browser events captured, 1-2 browser violations can be captured even if the subject did not leave the browser window (eg. in case of resizing window to meet minimum requirements.)

```
#MANUALLY INSPECT violations
```

```
df_participants %>% group_by(violations) %>%  
  dplyr::summarize(n=n())
```

```
## # A tibble: 6 x 2  
##   violations      n  
##   <dbl> <int>  
## 1      1     55  
## 2     1.5      3  
## 3      2     15  
## 4     2.5      1  
## 5      3      6  
## 6     3.5      2
```

```
#DISCARD participants exceeding the threshold of browser interaction violations
```

```
exclude_violations <- df_participants %>%  
  filter(violations > violation_threshold) %>%  
  mutate(reason="exceeded-violations")
```

```
ex_participants <- rbind(ex_participants, exclude_violations)  
rm(exclude_violations)
```

```
df_participants <- df_participants %>%  
  filter(! subject %in% ex_participants$subject)
```

*Two participants were excluded for exceeding the maximum allowed number of browser interaction violations.*

## Effort

To assist in mitigating increased noise in data collected asynchronously from the UCSD student subject pool, we added explicit ratings of how much effort the participant expended on the task. This question was implemented as a multiple-choice drop-down on an 'Effort' page prior to the 'Demographics' survey at the end of the study. Subjects were given four options : (1) I tried my best on each question, (2) I tried my best on most questions, (3) I started out trying hard, but gave up at some point, (4) I didn't try very hard, or rushed through the questions.

```
#MANUALLY INSPECT effort
```

```
df_participants %>% group_by(effort) %>%  
  dplyr::summarize(n=n())
```

```
## # A tibble: 4 x 2  
##   effort      n  
##   <chr> <int>
```

## 1 I didn't try very hard, or rushed through the questions	3
## 2 I started out trying hard, but gave up at some point	6
## 3 I tried my best on each question	50
## 4 I tried my best on most questions	21

Participants answering with options *I didn't try very hard, or rushed through the questions* are excluded for all analyses. Participants answering *I started out trying hard, but gave up at some point* **are** included in analysis, as we are interested in problem solving strategy under the condition of losing motivation.

```
#DISCARD participants who indicated they did not expend adequate effort on the study
exclude_effort <- df_participants %>%
  filter(effort %in% effort_exclusion) %>%
  mutate(reason="selfrated-effort")

ex_participants <- rbind(ex_participants, exclude_effort)
rm(exclude_effort)

df_participants <- df_participants %>%
  filter( ! subject %in% ex_participants$subject)
```

Three participants are excluded for low (self-rated) effort.

## Items

Finally, we need to discard item\_level data for excluded participants.

```
ex_items <- df_items %>%
  filter (subject %in% ex_participants$subject)

df_items <- df_items %>%
  filter (!subject %in% ex_participants$subject )
```

## Data Export

### Save Exclusions

For transparency, we save and identify the excluded data.

```
write.csv(ex_participants,"study_files/excluded_participants.csv", row.names = FALSE)
write.csv(ex_items,"study_files/excluded_items.csv", row.names = FALSE)
```

### Analysis-Ready Files

```
#save participant file

write.csv(df_participants,"study_files/winter22_sgc3a_participants.csv", row.names = FALSE)

#save item file
write.csv(df_items,"study_files/winter22_sgc3a_items.csv", row.names = FALSE)
```
